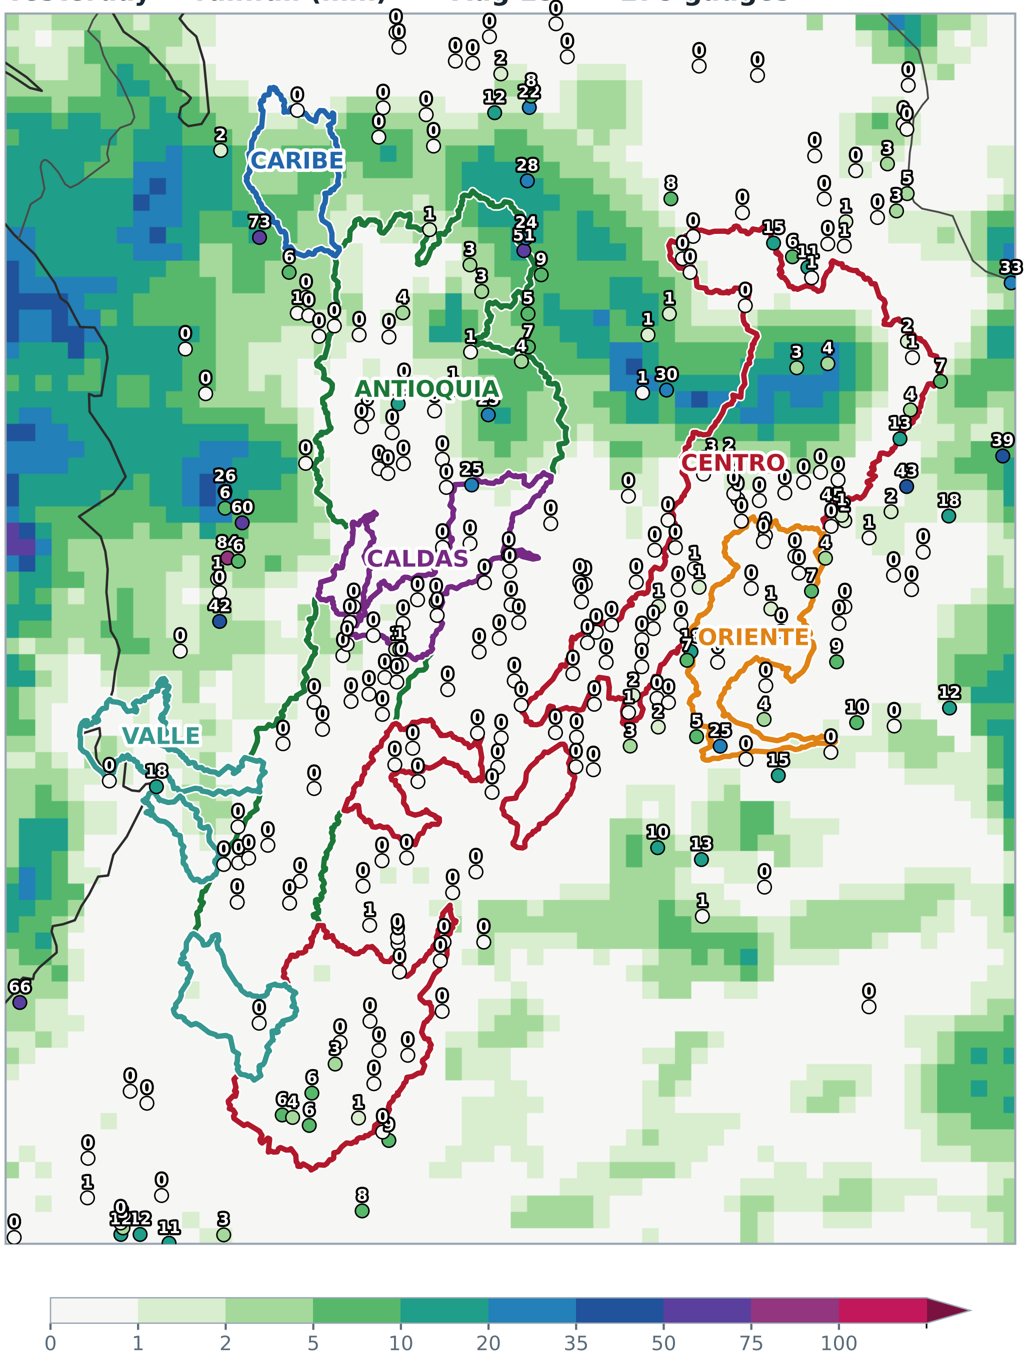
COLOMBIA HYDRO — DAILY BRIEFING

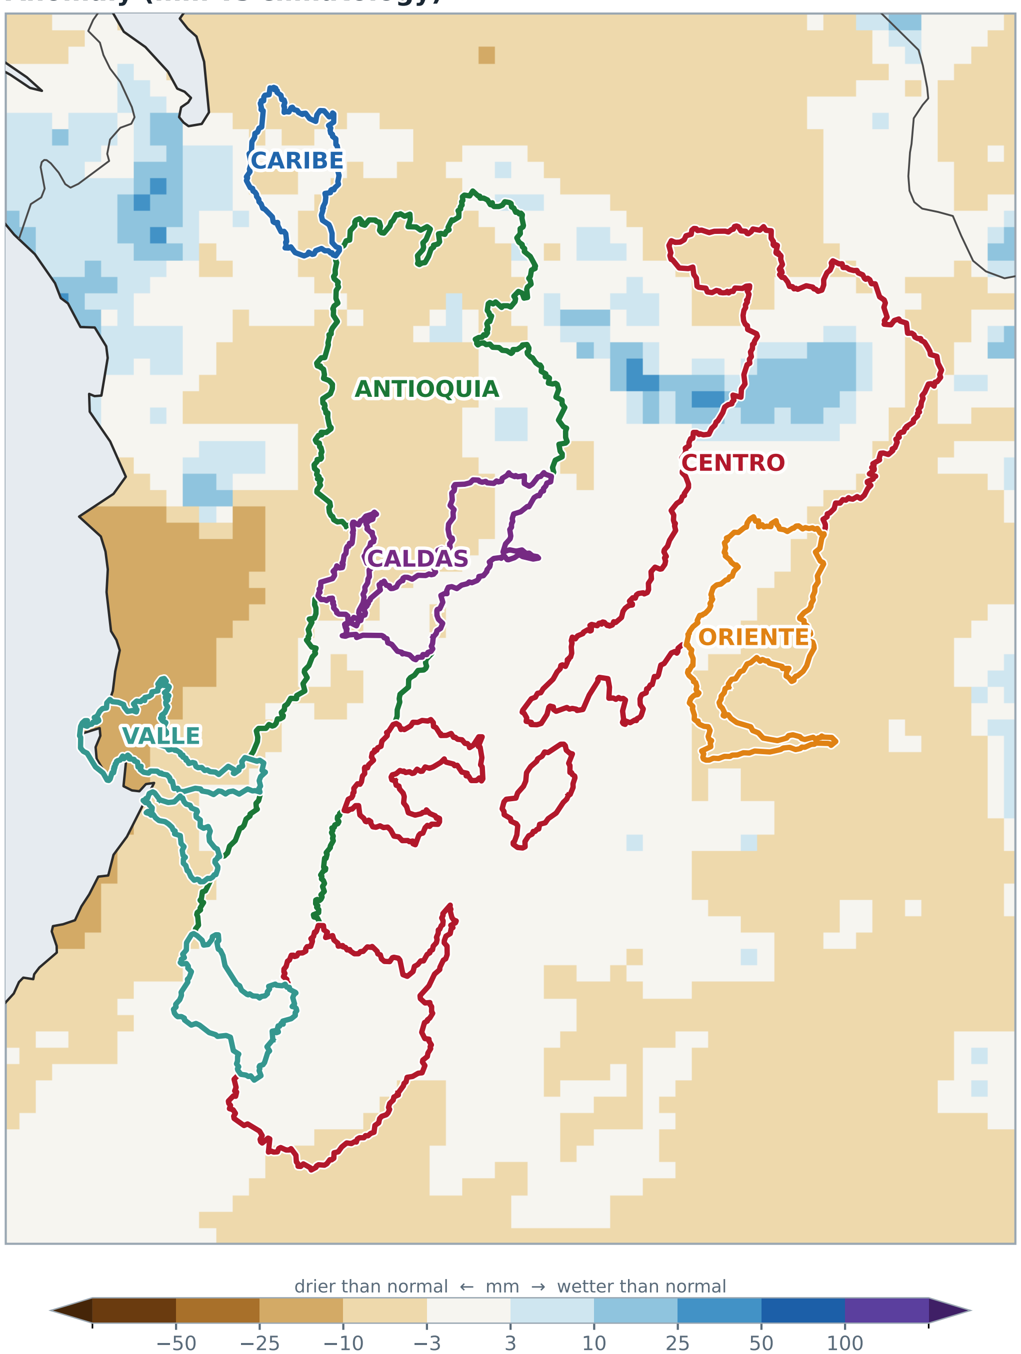
Sunday, August 16, 2026

Basin rainfall · GPM IMERG corrected by ~500 IDEAM gauges (43% station error reduction, held-out validation)

Yesterday — rainfall (mm) · Aug 15 · 278 gauges



Anomaly (mm vs climatology)



1 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

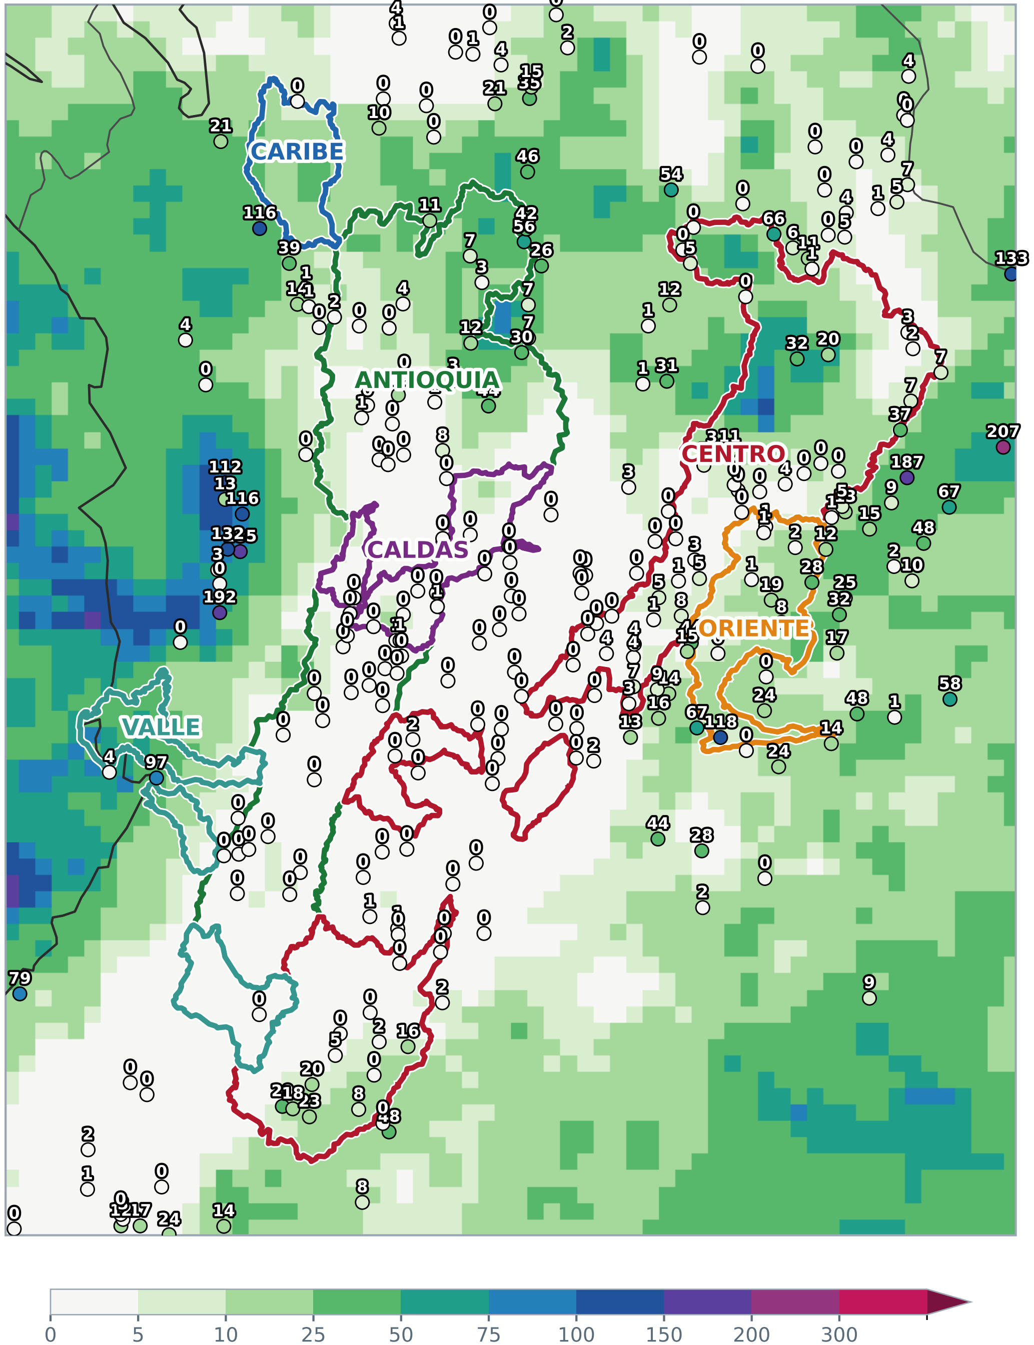
generated 2026-08-16 22:00 UTC

COLOMBIA HYDRO — DAILY BRIEFING

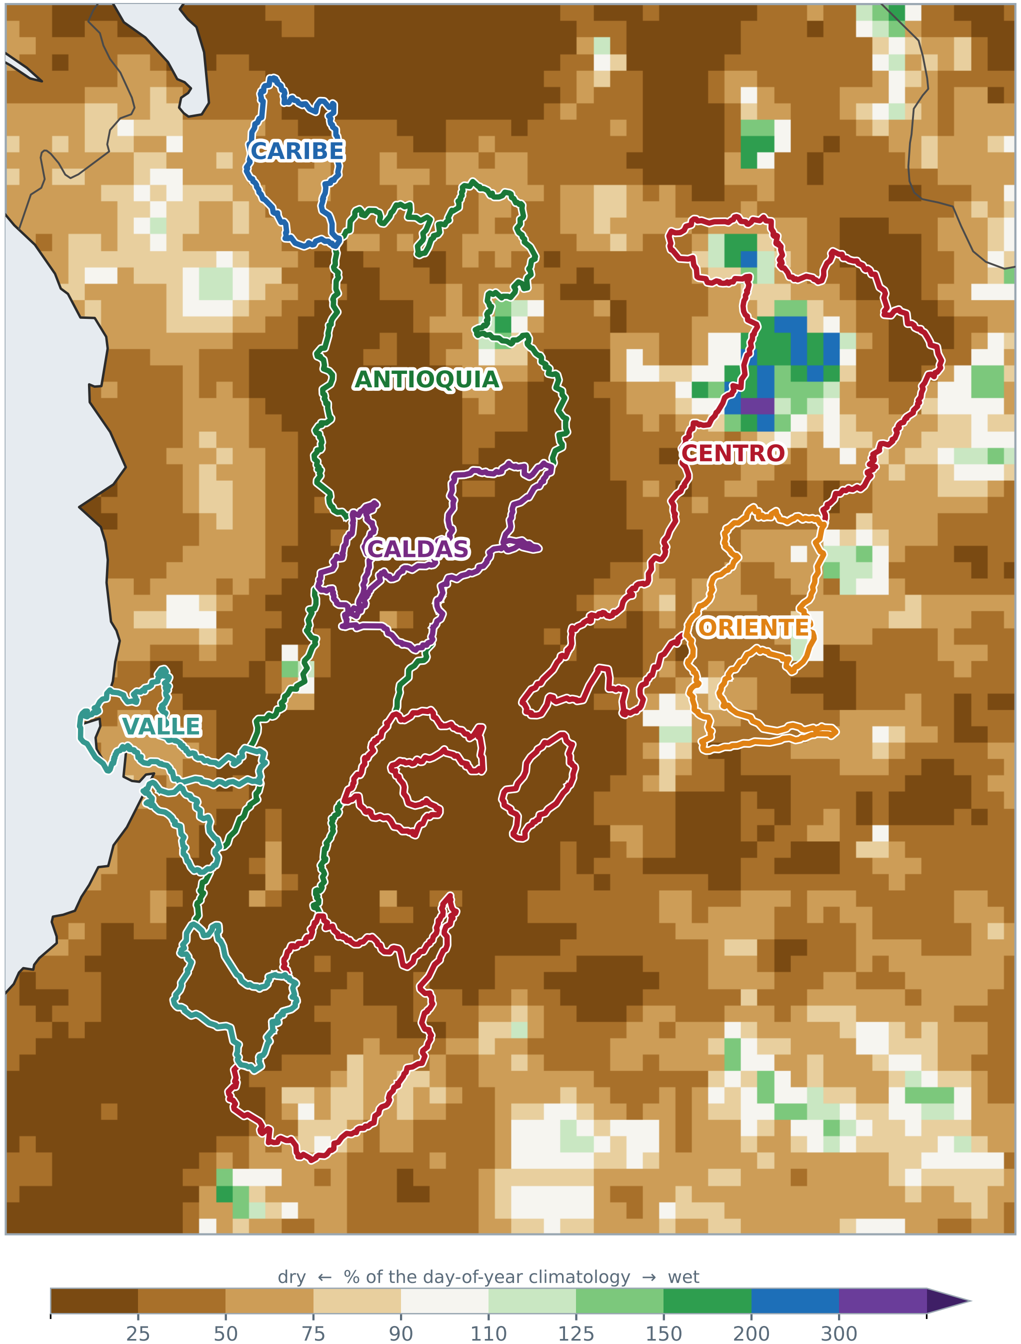
Sunday, August 16, 2026

Basin rainfall · GPM IMERG corrected by ~500 IDEAM gauges (43% station error reduction, held-out validation)

Last 7 days — rainfall (mm) · Aug 09 – Aug 15 · 275 gauges

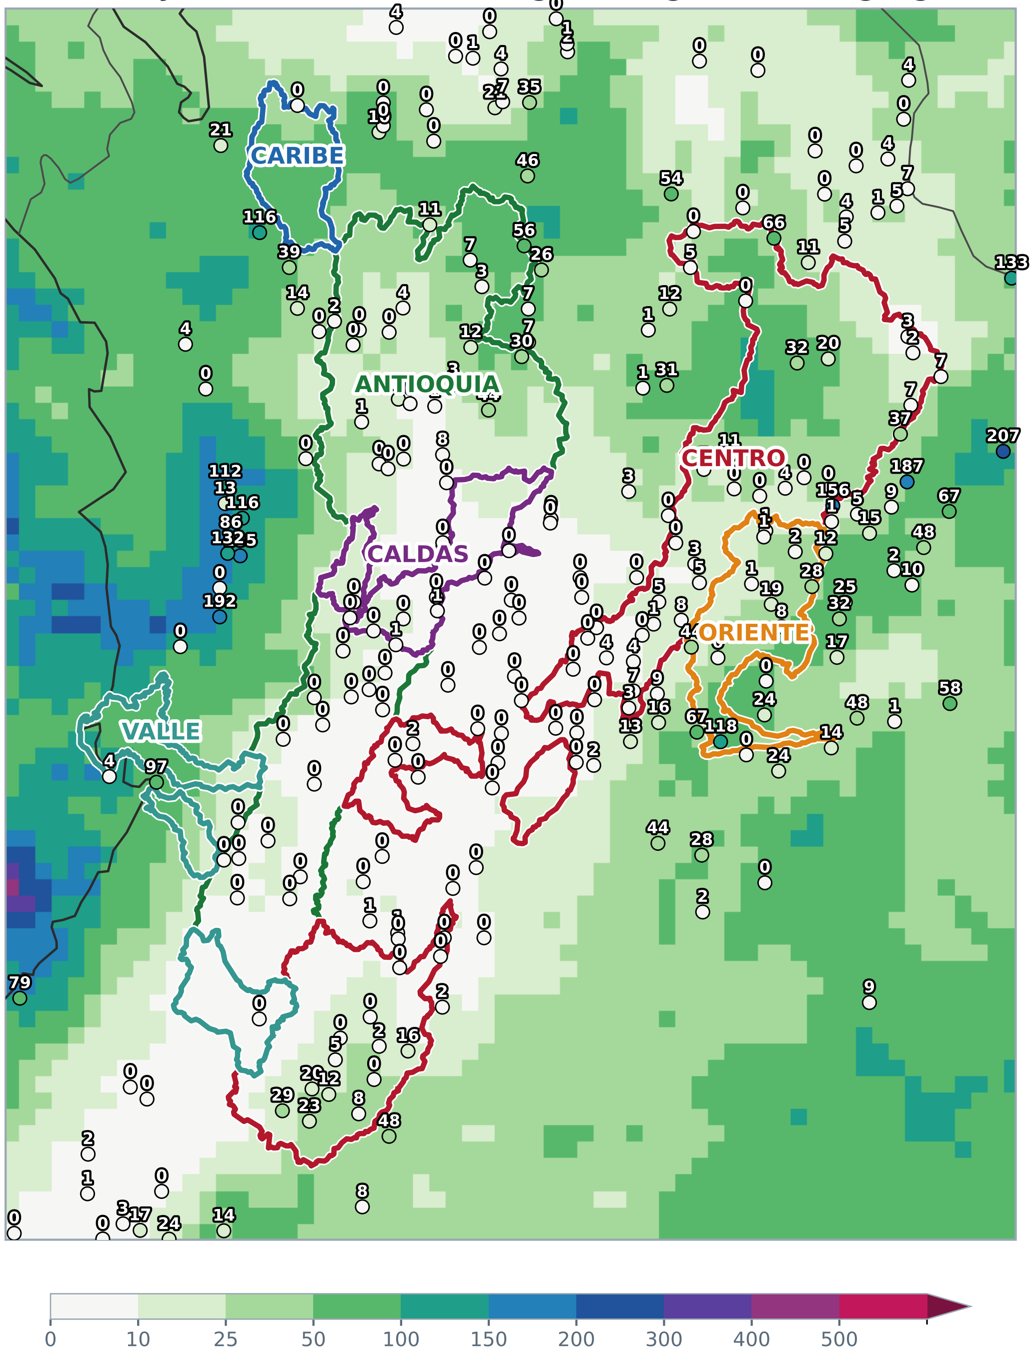


Percent of normal

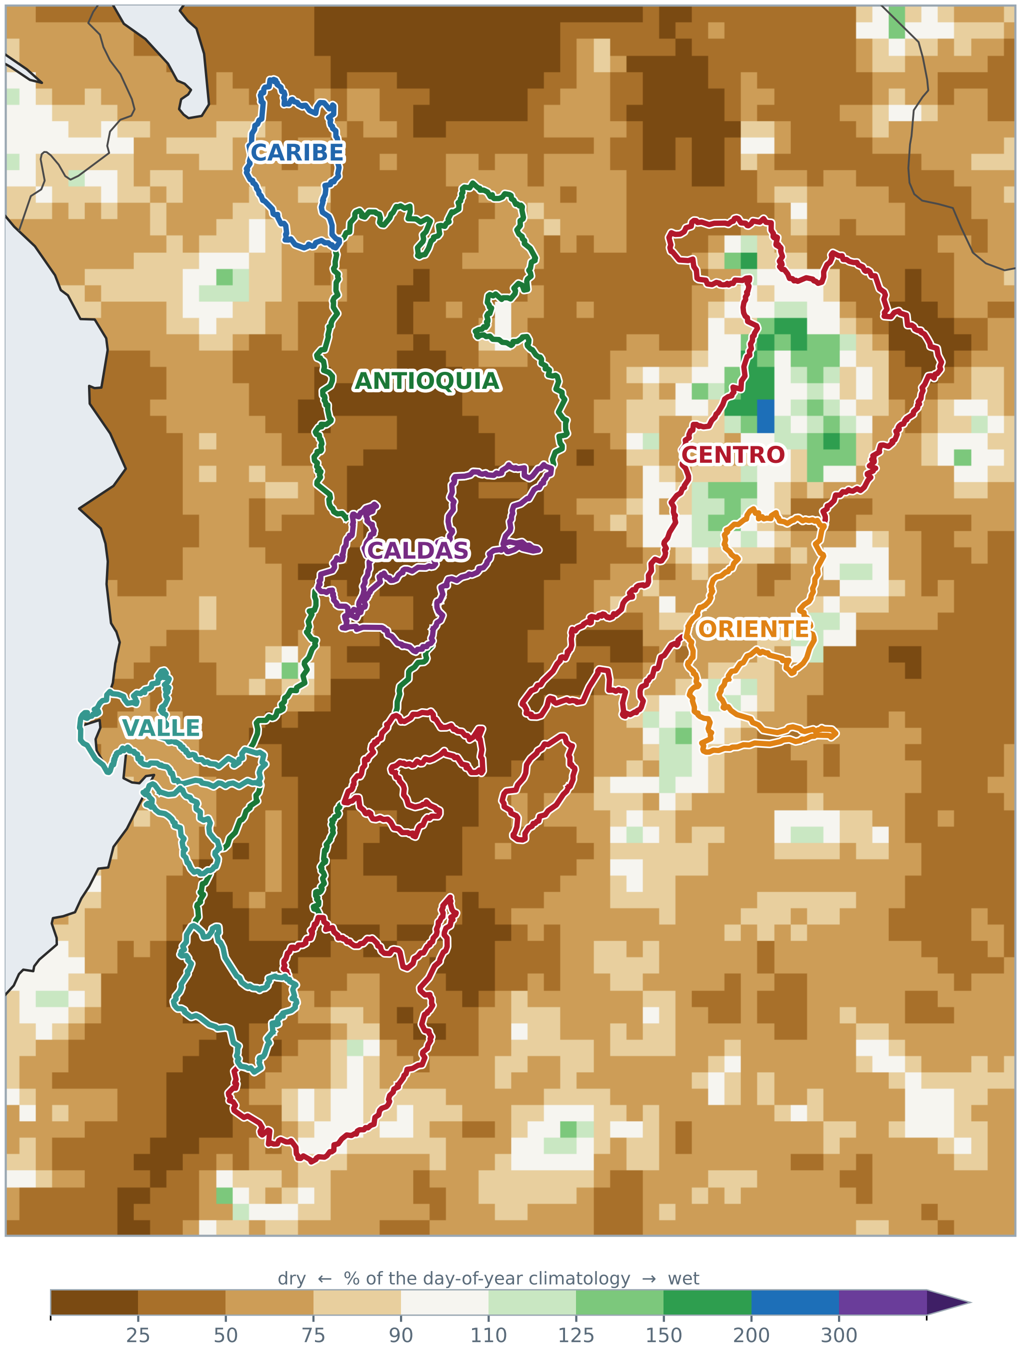


7 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

Last 14 days — rainfall (mm) · Aug 02 – Aug 15 · 247 gauges

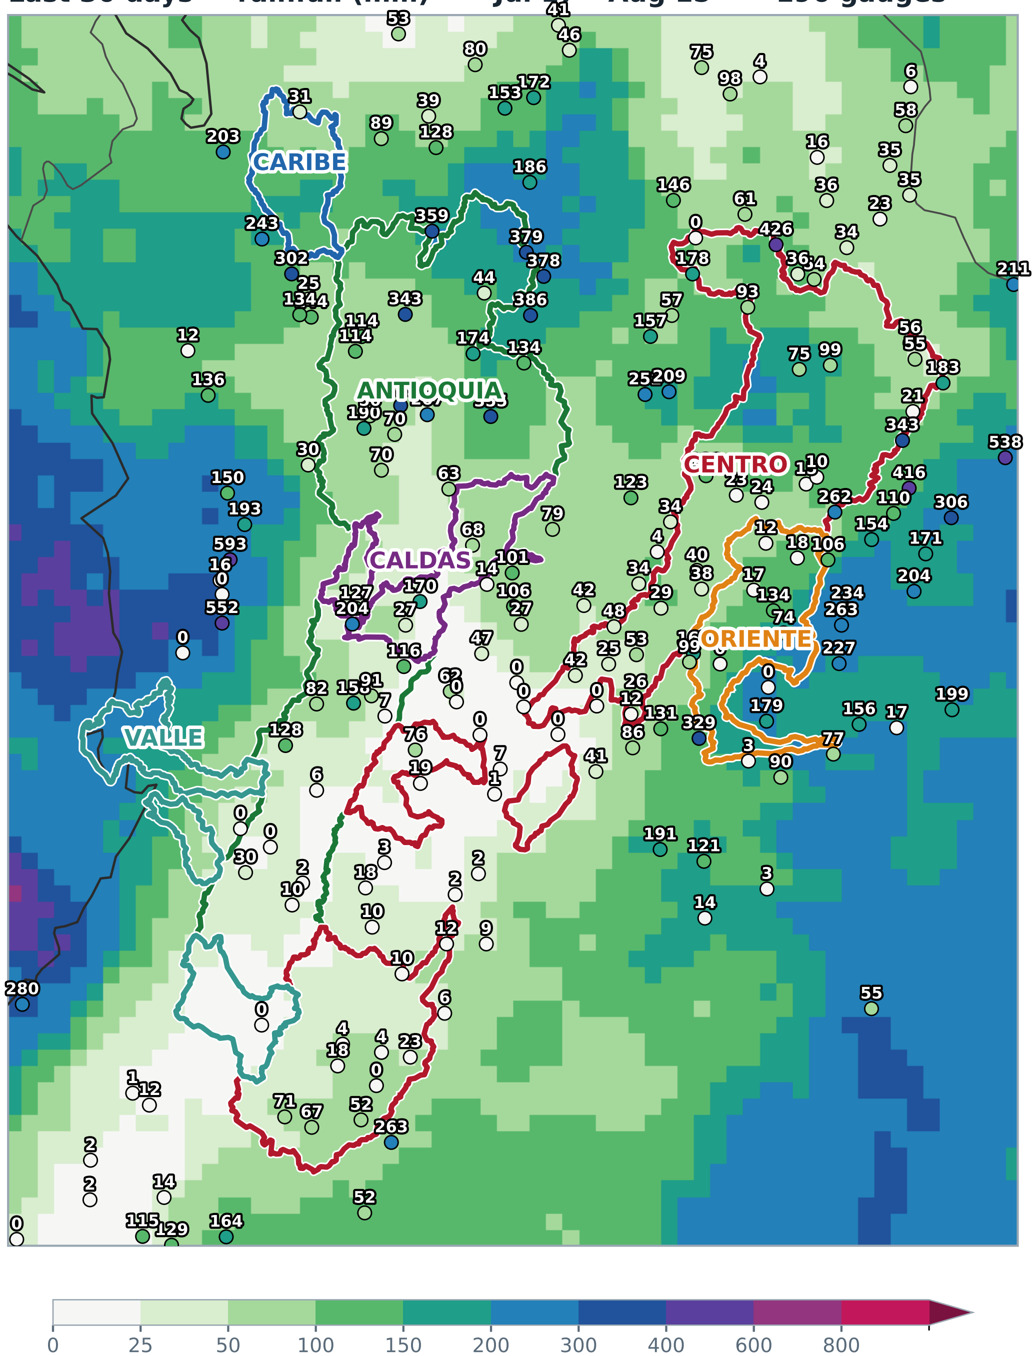


Percent of normal

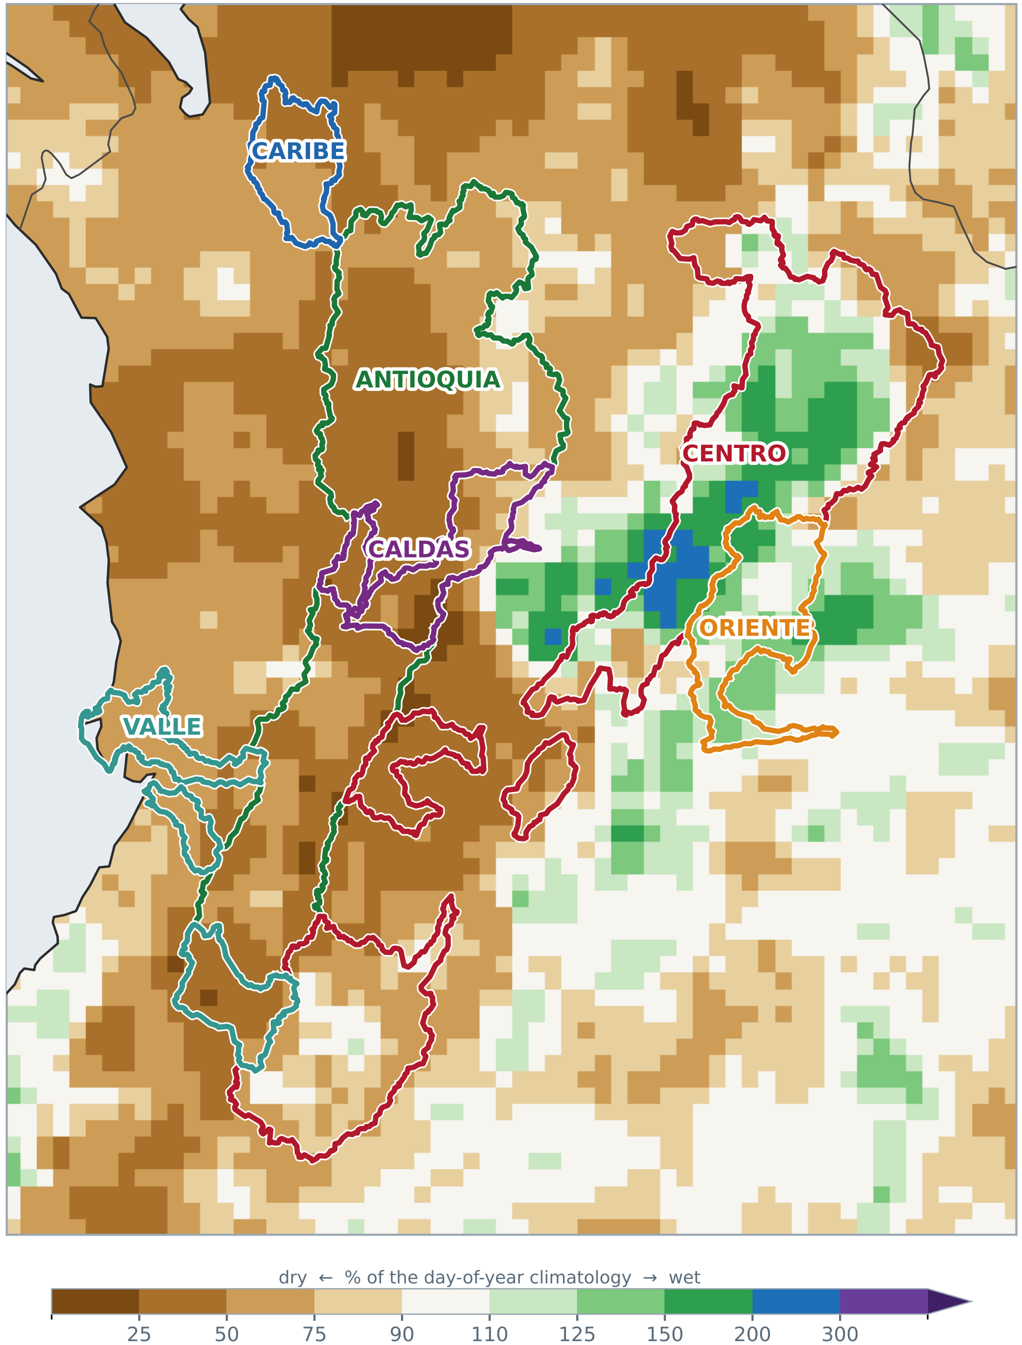


14 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

Last 30 days — rainfall (mm) · Jul 17 – Aug 15 · 196 gauges



Percent of normal

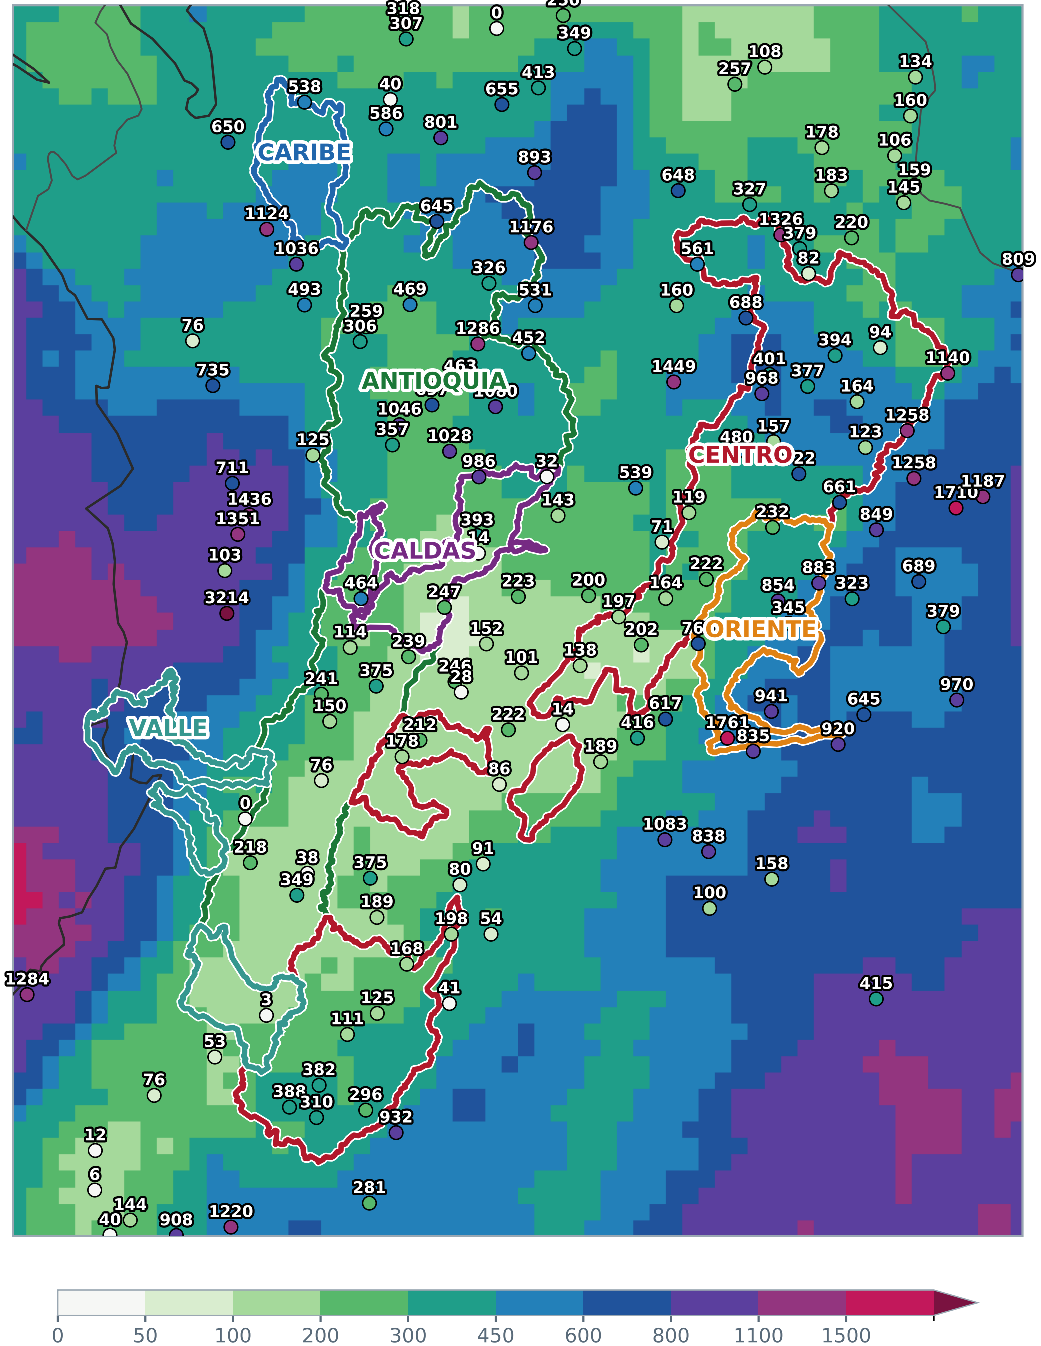


COLOMBIA HYDRO — DAILY BRIEFING

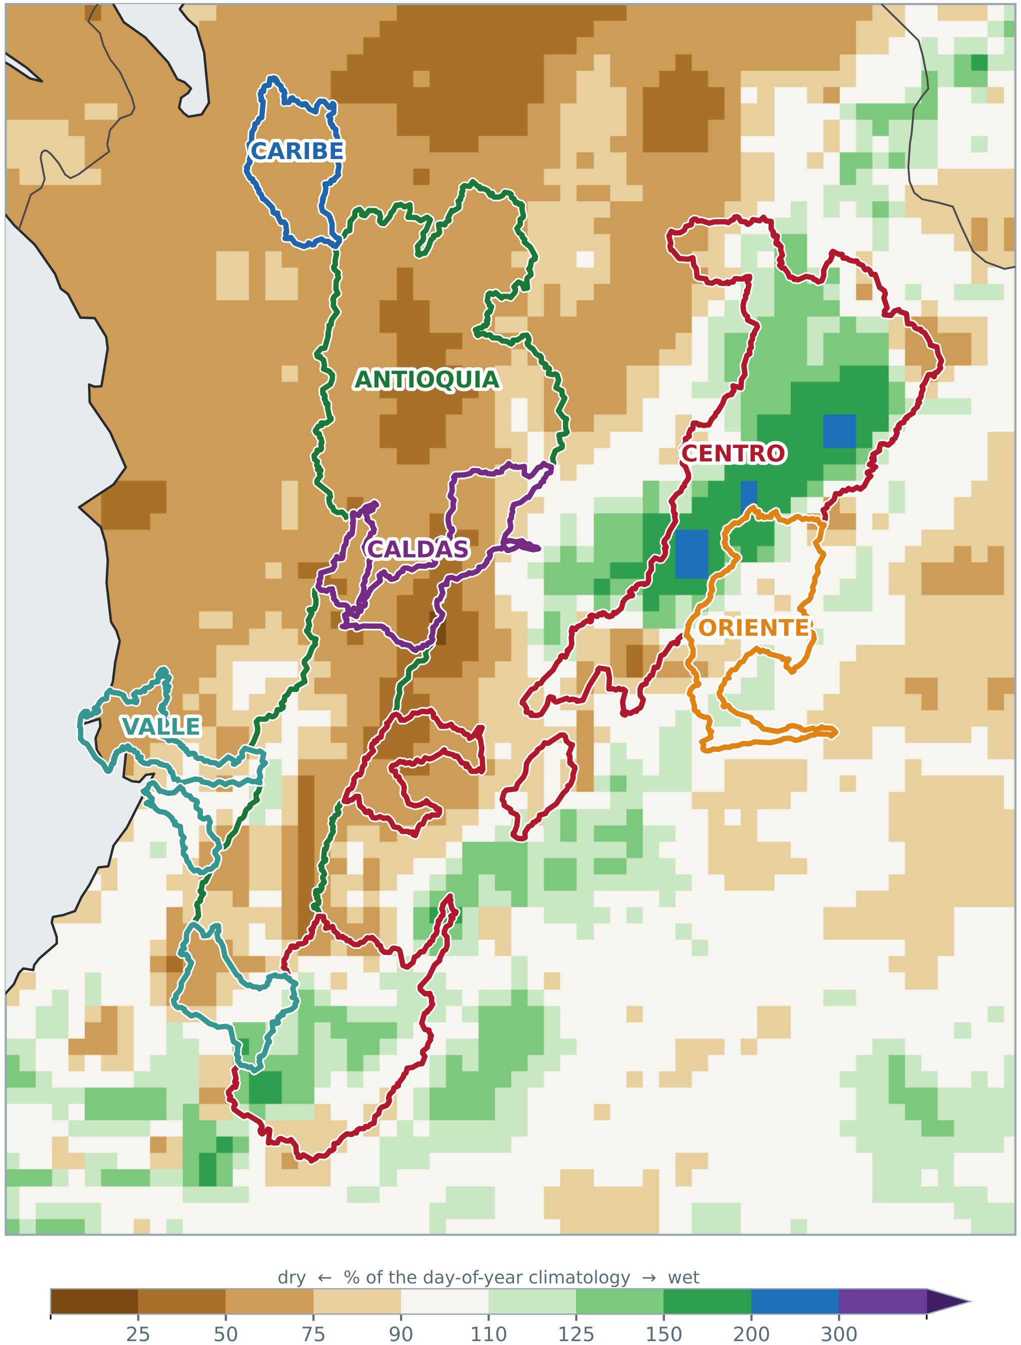
Sunday, August 16, 2026

Basin rainfall · GPM IMERG corrected by ~500 IDEAM gauges (43% station error reduction, held-out validation)

Last 90 days — rainfall (mm) · May 18 – Aug 15 · 160 gauges

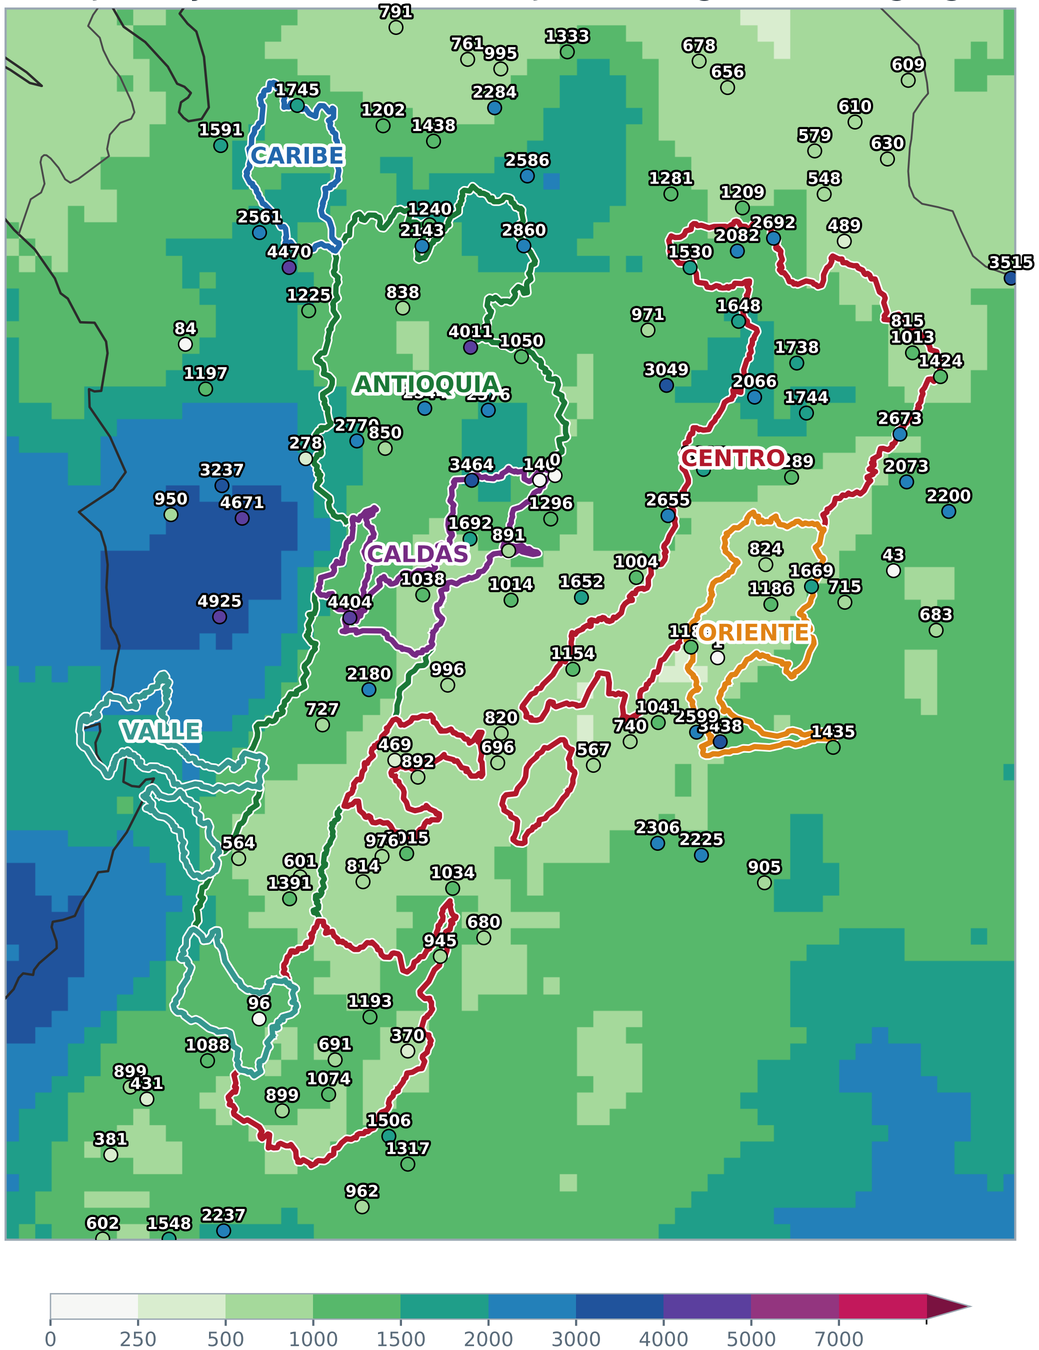


Percent of normal

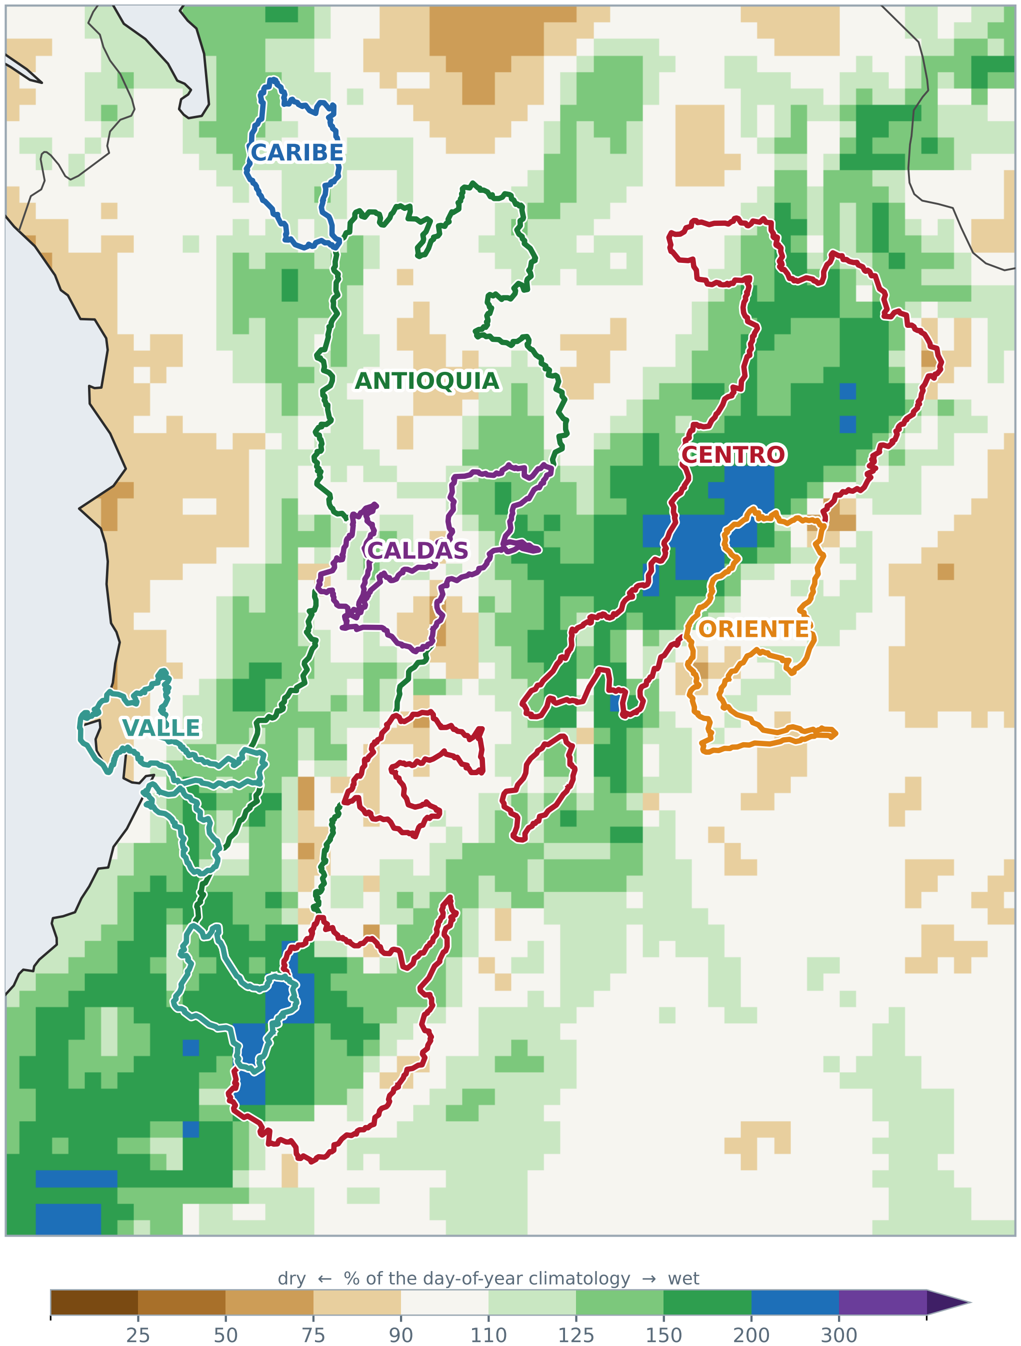


90 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

Since January 1 — rainfall (mm) · Jan 01 – Aug 15 · 120 gauges

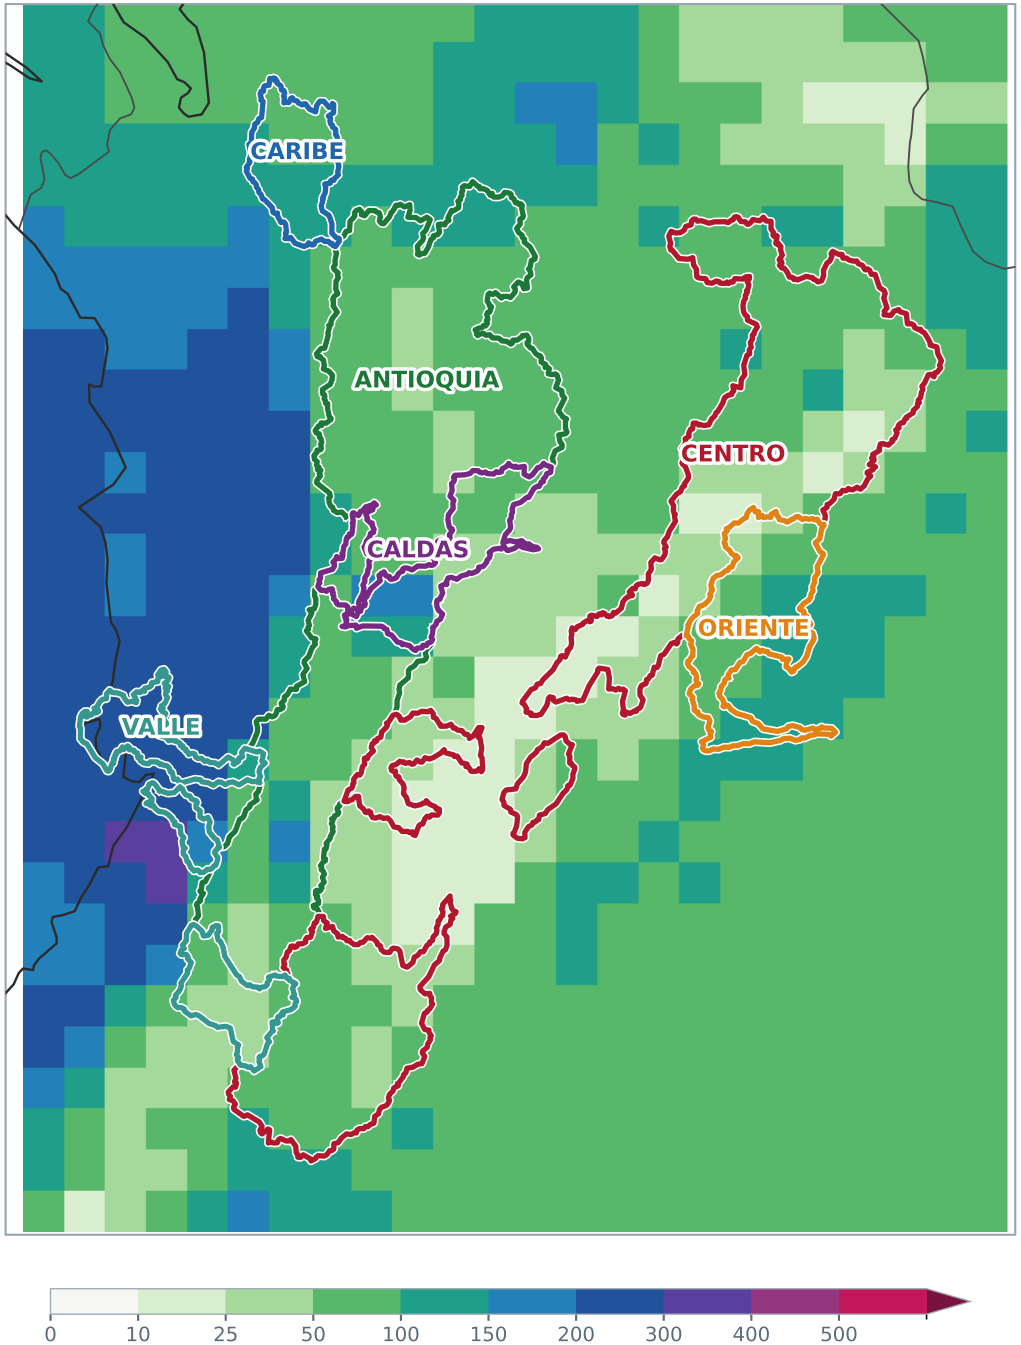


Percent of normal

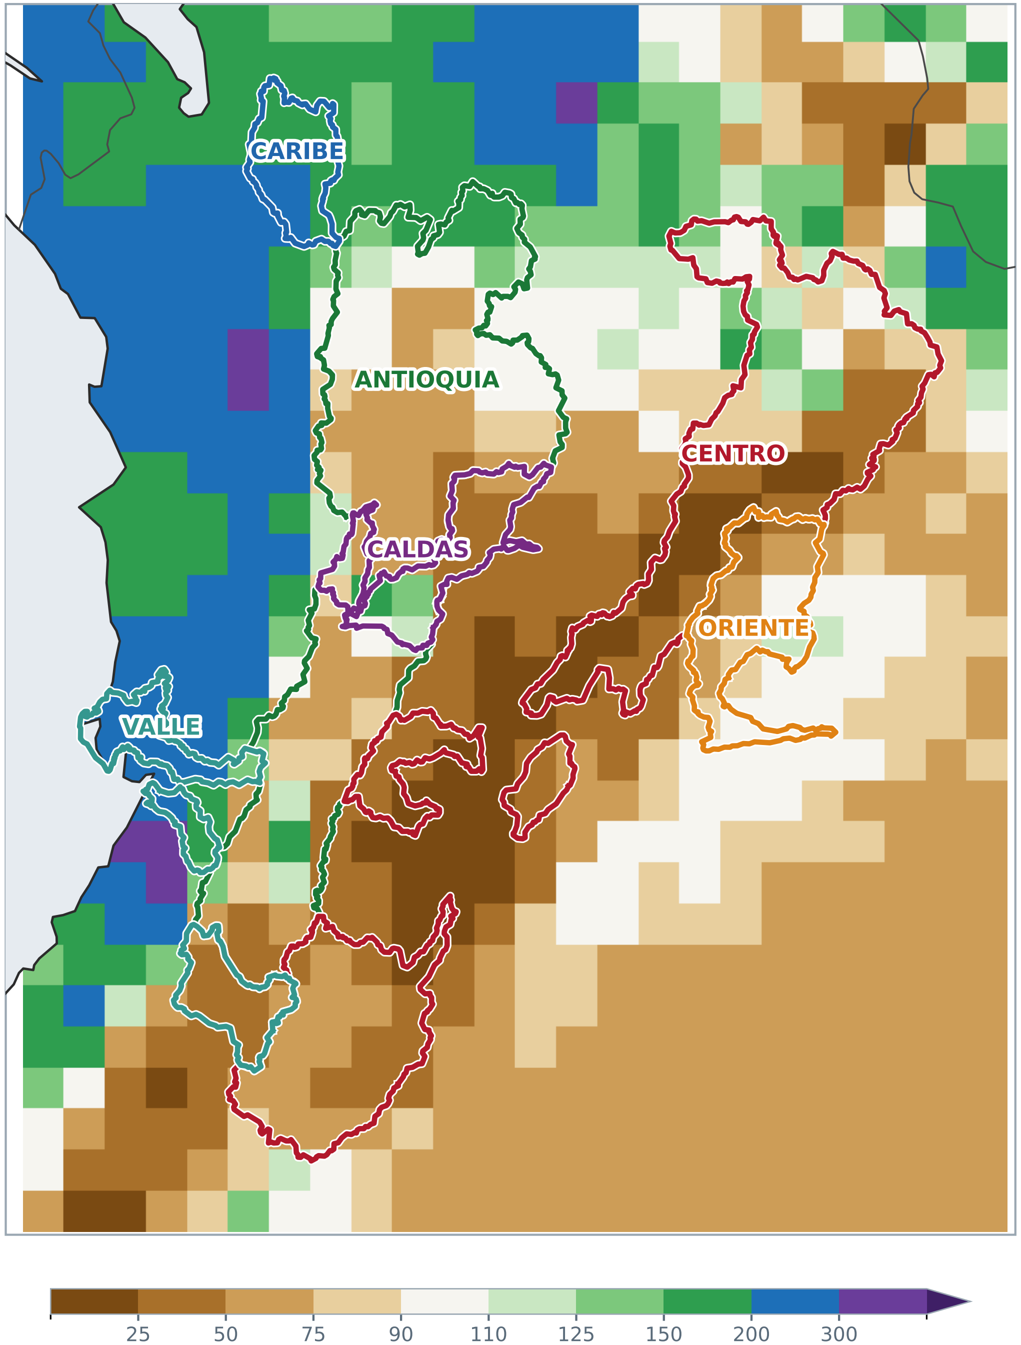


227 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

Skill-corrected total (mm) · Aug 17 – Aug 30



Percent of normal

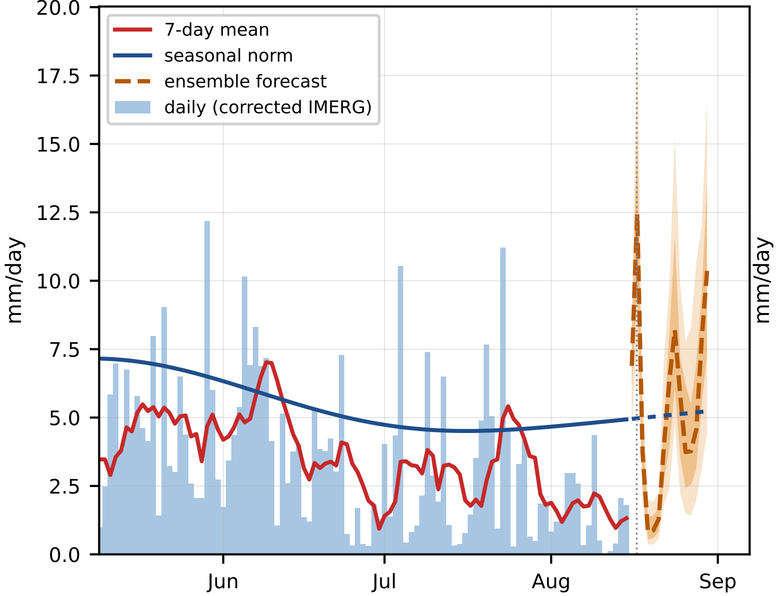


COLOMBIA HYDRO — DAILY BRIEFING

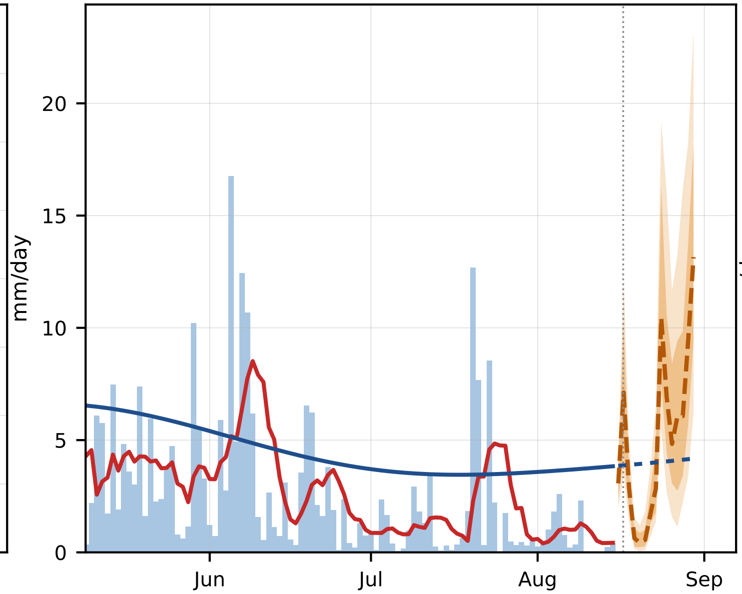
Sunday, August 16, 2026

Basin rainfall vs seasonal norm · gauge-corrected IMERG observed · bias-corrected AIFS-ENS + IFS-ENS ensemble forecast

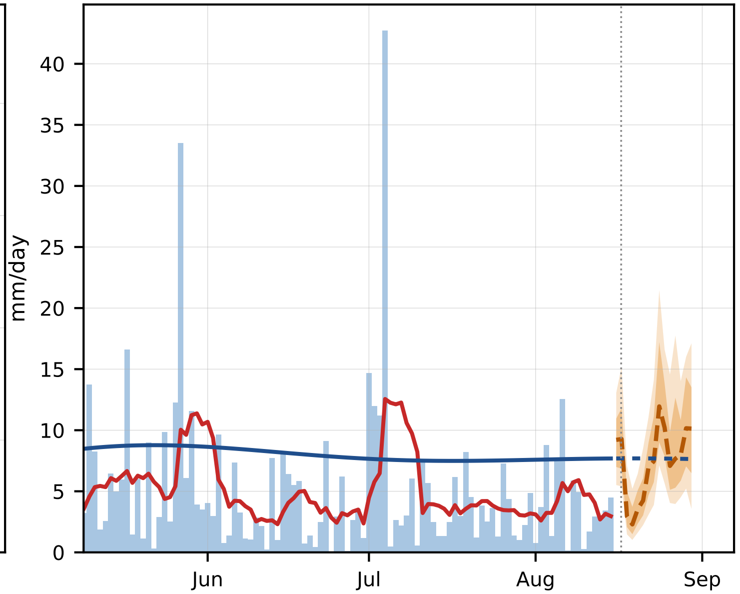
ANTIOQUIA · last 7 d: 27% of norm



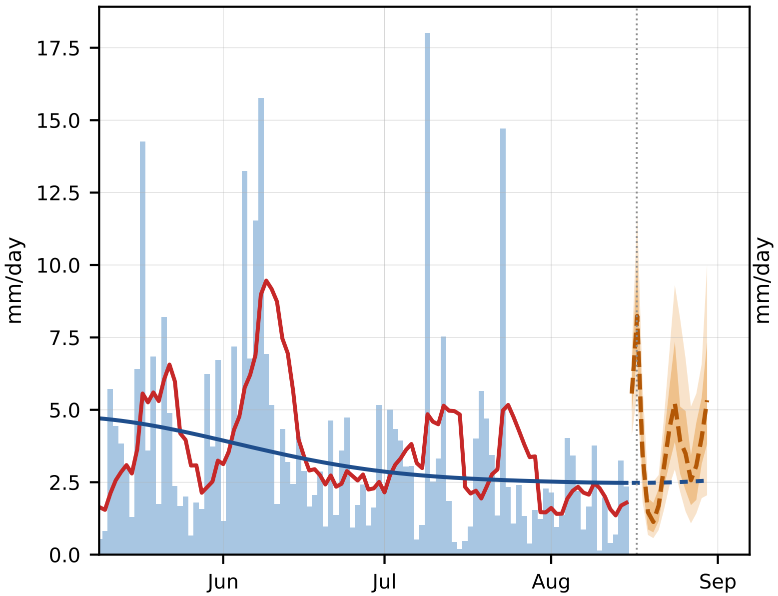
CALDAS · last 7 d: 11% of norm



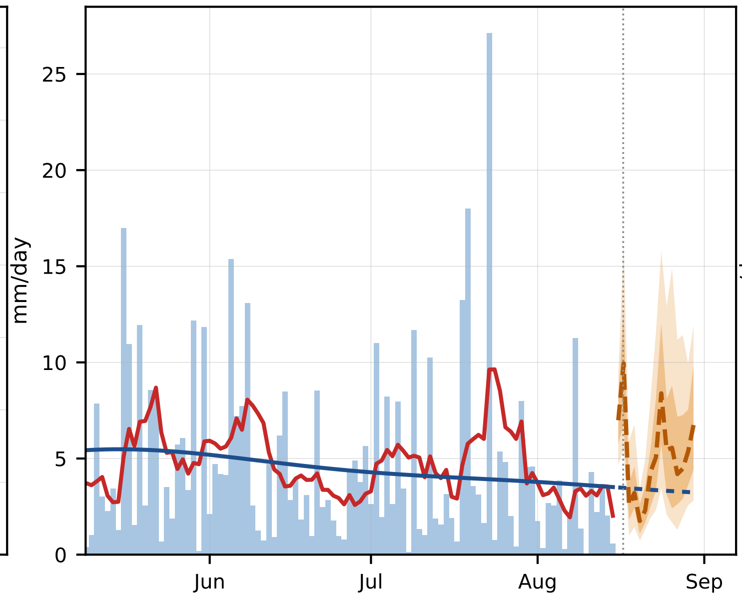
CARIBE · last 7 d: 39% of norm



CENTRO · last 7 d: 72% of norm



ORIENTE · last 7 d: 57% of norm



VALLE · last 7 d: 43% of norm

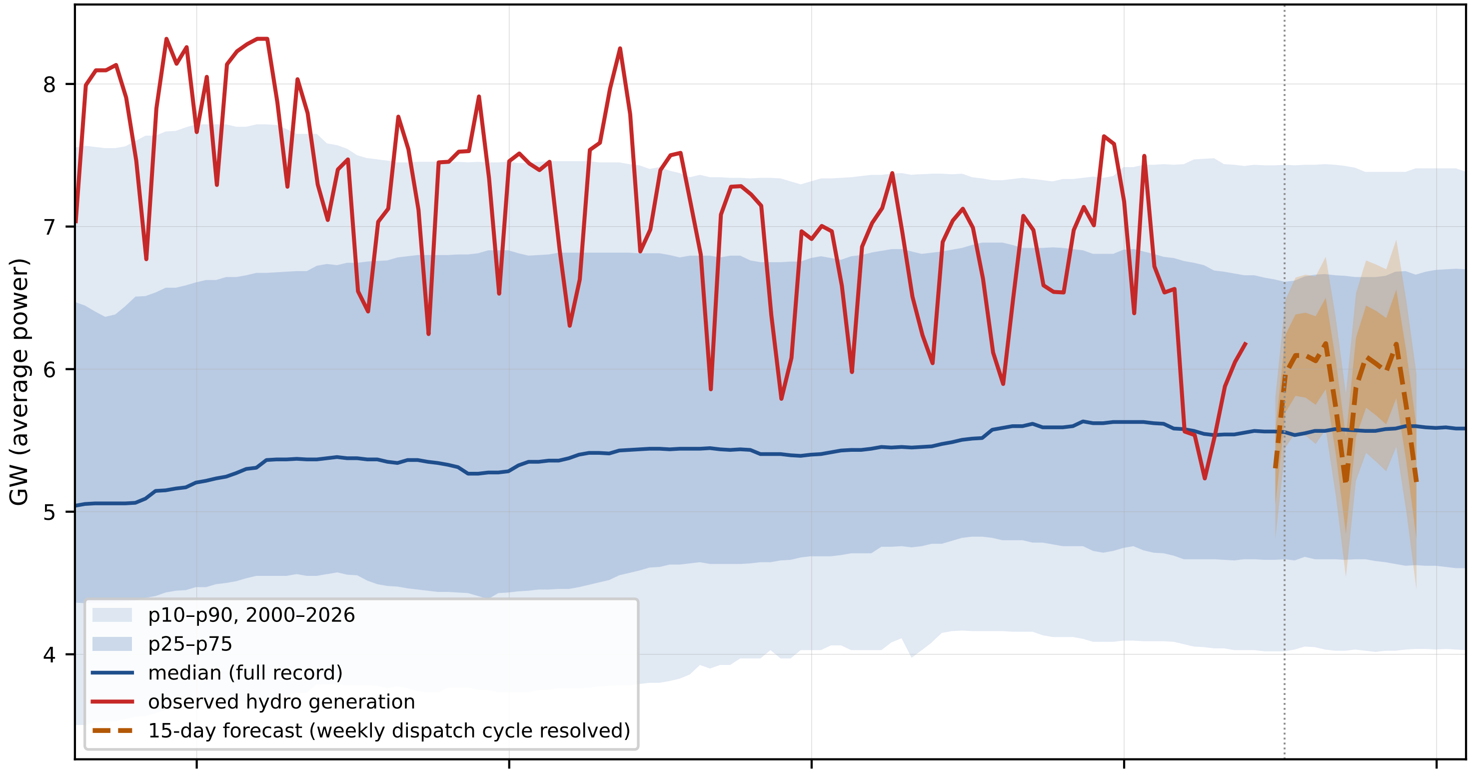
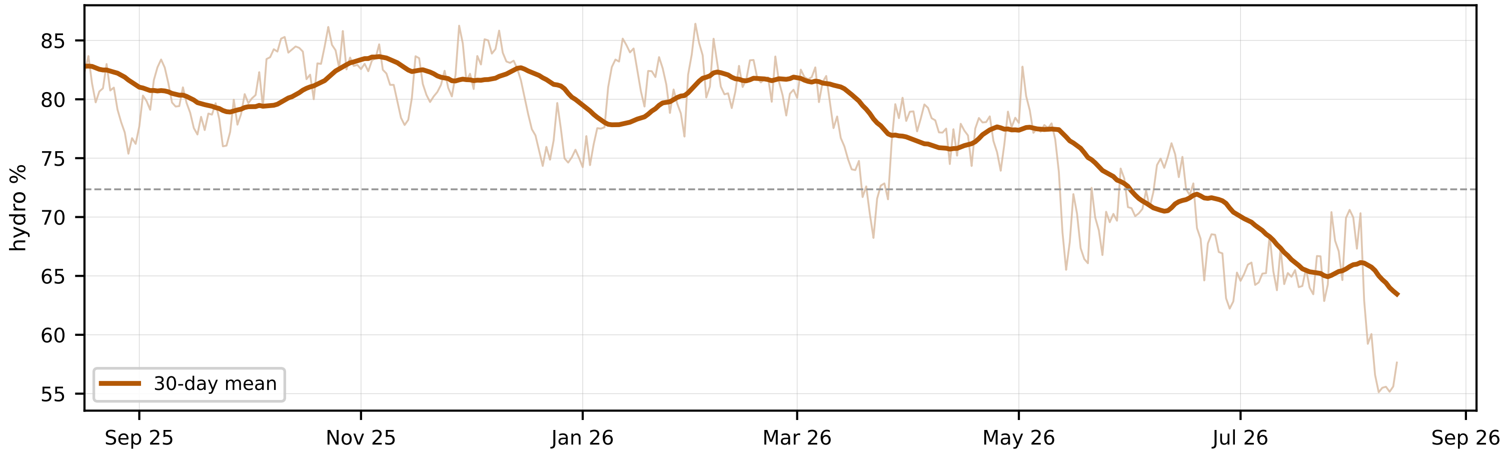
National hydro generation — last 120 days, forecast fan, and the 26-year day-of-year envelope



Hydro share of total generation — thermal dispatch fills the gap as El Niño cuts inflows



HYDRO, 30-DAY MEAN

6.57 GW

63% of total generation

RESERVOIRS

77.6% full

useful storage 13.6 of 17.5 TWh

ENSO

Niño-3.4 +2.1 °C

El Niño conditions

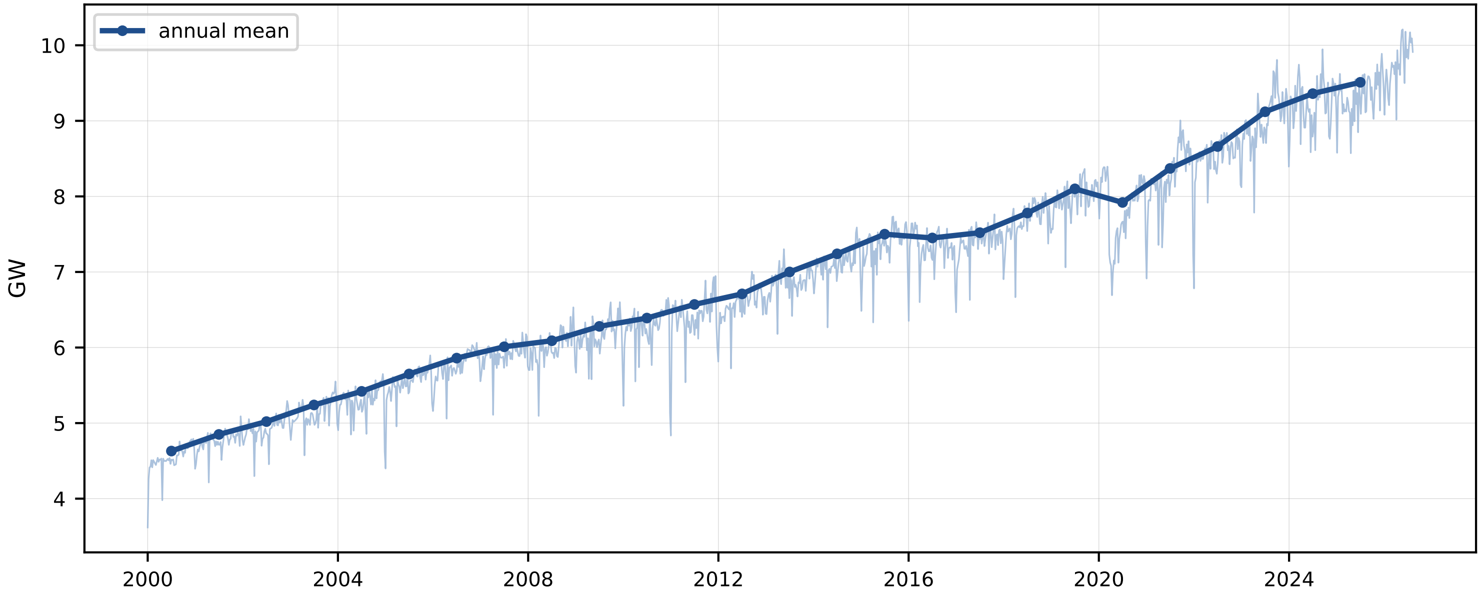
MODEL SKILL

r = 0.59

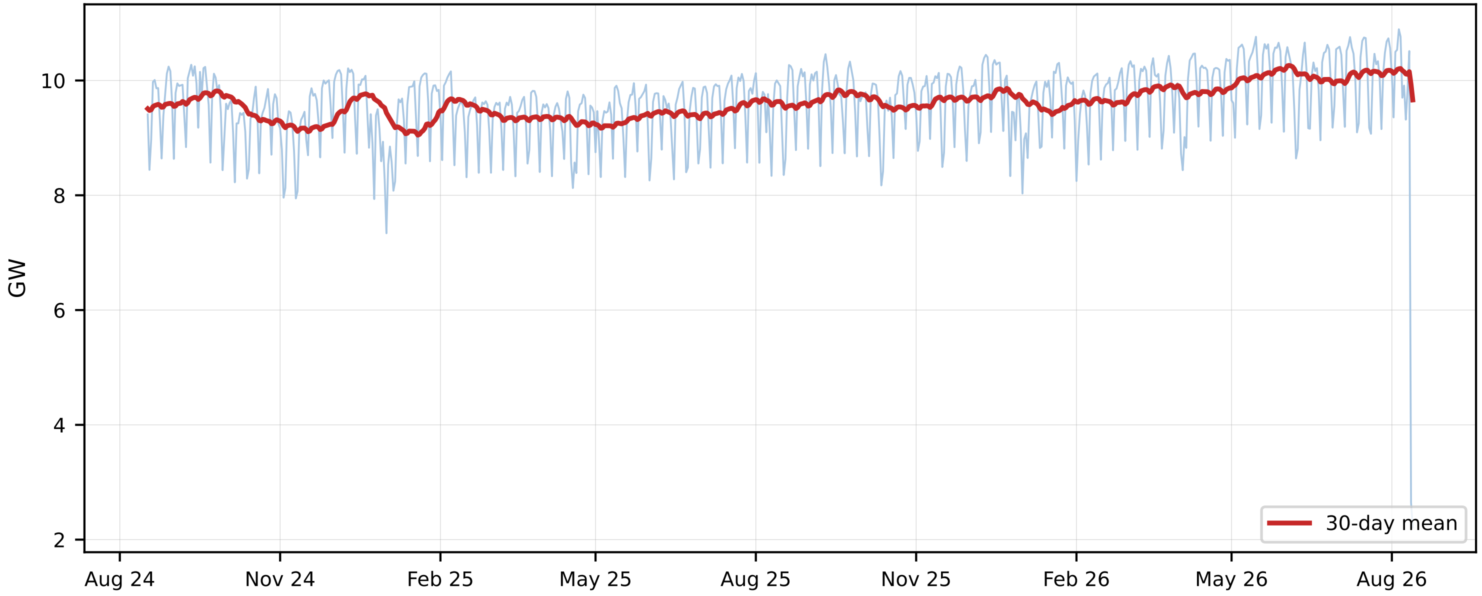
state model, 23-yr out-of-sample

Forecast = fitted persistence (dispatch is storage-buffered) blended with the inflow/storage/ENSO state model, driven member-by-member by the same AIFS+IFS rain ensemble as the basin pages. Bands widen by the blend's measured residual uncertainty at each lead.

Demand, 2000–2026 — weekly samples + annual means



Last two years — daily (weekly dispatch cycle visible) and 30-day mean



DEMAND, 30-DAY MEAN

9.66 GW

national daily average power

GROWTH

+1.6% YoY

annual mean 2025 vs 2024

TEMPERATURE LINK

-0.28 %/°C

monthly r = -0.057 · 2000–2023, 4-city pop-weighted ERA5

DAILY SENSITIVITY

0.79 %/°C

daily r = 0.11 (weekday-adjusted, detrended)

The honest result: temperature barely moves Colombian demand — a weak daily bump (~0.8%/°C, r≈0.1) and nothing at monthly scale. Near-equatorial, mild Andean cities have no heating/cooling season; growth drives the curve. El Niño's risk here is supply (hydro), not demand.
