COLOMBIA HYDRO — DAILY BRIEFING

Sunday, August 16, 2026

Basin rainfall · GPM IMERG corrected by ~500 IDEAM gauges (43% station error reduction, held-out validation)

satellite through Aug 15 · page 6

Since January 1 — rainfall (mm) · Jan 01 - Aug 15 · 120 gauges

scorvec.com/colombia_hydro

227 satellite days in window · gauge dots share the map color scale — a dot that vanishes means satellite and gauge agree

National hydro generation — last 120 days, forecast fan, and the 26-year day-of-year envelope

HYDRO, 30-DAY MEAN

6.57 GW

63% of total generation

RESERVOIRS

77.6% full

useful storage 13.6 of 17.5 TWh

ENSO

Niño-3.4 +2.1 °C

El Niño conditions

MODEL SKILL

r = 0.59

state model, 23-yr out-of-sample

Forecast = fitted persistence (dispatch is storage-buffered) blended with the inflow/storage/ENSO state model, driven member-by-member by the same AIFS+IFS rain ensemble as the basin pages. Bands widen by the blend's measured residual uncertainty at each lead.
